

Protest of the Bureau of Land Management's Notice of Competitive Oil and Gas Lease Sale in Wayne National Forest

Dear Karen E. Mouritsen,

My name is Sydney Elise Slee and I'm a student at The Ohio State University studying anthropology and archaeology. I have reviewed the internet-based lease-sale for parcels of land in Wayne National Forest, and hereby object to the sale put forth by the Federal government concerning over 1,600 acres of mineral rights beneath the forest. My objections refer to the 28 parcels of land attached to this letter, and I object for the reasons outlined in the remainder of this letter. I have no affiliation with an organization, I just want to save our forest.

My name and address is:

Sydney Slee
7653 Sweetwood Ct
Dublin Oh, 43016

Reason #1: Fracking Results in Unprecedented Amounts of Earthquakes

Oklahoma, home to hundreds of fracking sites, is now more earthquake-prone than California. Between 1990 and 2008, Oklahoma had only three earthquakes per year that registered at 3.0 or more on the Richter scale. In 2013, Oklahoma had 109 earthquakes. That number has increased to 238 as of June 2014. One quake caused by drilling destroyed 14 homes in Oklahoma City, injured two people and buckled pavement. Additional, persistent quakes will undoubtedly cause more injuries, potential deaths, and damage to infrastructure, costing taxpayers millions. EPA seismologists acknowledge a very clear correlation between fracking and earthquakes, saying the quakes would stop as soon as wells were turned off.

Reason #2: Fracking Results in Extreme Water Contamination

Fracking wells, which inject water, sand, and chemicals deep into the ground to extract natural gas, inevitably create significant runoff into groundwater systems. 40,000 gallons of 600 different kinds of chemicals are used in each fracking well, including formaldehyde, mercury, uranium, and hydrochloric acid. To run all the fracking wells in the United States, it takes 360 BILLION gallons of those harmful chemicals. And only 30 to 50 percent of those chemicals are reclaimed, while the rest is left in the ground, not biodegradable. Pennsylvania, a major fracking state, has just admitted that fracking has contaminated local water supplies 243 times in 22 counties.

In California, where a historic drought has already started water rationing in major population centers (more on that in section 3), 3 billion gallons of fracking waste just leaked into aquifers containing precious drinking water reserves for residents. Josh Fox's film "Gasland" illustrates that homes affected by fracking have flammable water. Drinking the water can cause respiratory, sensory, and neurological issues. And the situation in California is just a prelude to what's to come if fracking is allowed to

continue. In West Virginia, where 300,000 people had their drinking water contaminated by a chemical used by the coal industry this January, government officials are weighing proposals to frack under the Ohio River, which supplies drinking water to 3 million people.

Reason #3: Fracking Depletes the Value of Your Home

Exxon is one of the largest companies that engages in fracking. And in an ironic twist, Exxon CEO Rex Tillerson became a fracking protester when well drilling was about to happen next to his home. Through his attorney, Tillerson said he wasn't concerned about the environmental impact, but rather the impact to his property values. As I've written in the previous sections, Tillerson is obviously wrong to not be worried about the environmental costs of fracking, but he's 100 percent correct about what fracking does to homes. A study by the University of Denver found that fracking can reduce a home's value by 25 percent on average. And of 550 people surveyed, most wouldn't buy a home near a fracking site. Researchers looking at 43 counties in New York and Pennsylvania also learned that a house within 0.6 miles of a fracking site that depends on wells for its drinking water rather than municipal sources saw the value of their home plummet by 16.7 percent.

Fracking will destroy the land National Forests were created to protect. By selling this land we will lose Ohio's only National Forest, destroying it for every generation to come. We must protect our environment, our water and our homes. This is why I object to the selling of parcels in Wayne National Forest.

Reason #4: This Decision Sets a Precedent for the Further Destruction of our Protected lands

Selling this land now sets a further precedent for future sales of land that was once protected. If these kinds of decisions continue on there will be no protected land left for our children and grandchildren. It may seem like a good boost to the economy of Ohio now, but it further damages Ohio's future in this world and the future of the planet as a whole. The sooner we stand up to oil drilling practices that damage our environment and perpetuate the reliance on nonrenewable energy sources, the easier our transition to renewable clean energy sources will be. If Ohio steps up now to advance clean energy sources and break our reliance on the oil industries of the world, then Ohio will be better off in the future as Oil resources begin to run out. We will be ahead of the rest of the world and will have preserved the ecology of our beautiful state.

Fracking will destroy the land National Forests were created to protect. By selling this land we will lose Ohio's only National Forest, destroying it for every generation to come. We must protect our environment, our water and our homes. This is why I object to the selling of parcels in Wayne National Forest.

Sincerely,
Sydney Elise Slee
